

Linux Read Operation Command

28 November 2024

11:01

1. **info**
 - Provide the information about command Ex. `l=info <command_name>`
2. **man**
 - Manual for a command to give the detailed information Ex. `man`
3. **--help**
 - To provide the info
4. **which**
 - to show the path of file

1. Read File Contents

- **cat**: Display the entire contents of a file.
`cat filename`
- **less**: View file contents one page at a time (scrollable).
`less filename`
- **more**: Similar to less, but with fewer features.
`more filename`
- **head**: Display the first few lines of a file.
`head filename`
- **tail**: Display the last few lines of a file.
`tail filename`

For real-time updates (e.g., log files):

`tail -f filename`

2. Read File Metadata

- **stat**: Show detailed metadata about a file.
`stat filename`
- **ls -l**: List files with basic metadata.
`ls -l filename`

3. Read Input from User

- **read**: Accept user input in a shell script or interactive terminal.
`read variable_name`
`echo "You entered: $variable_name"`

4. Read System Information

- **cat /proc/**: Access system-level information.
 - CPU details:
`cat /proc/cpuinfo`
 - Memory details:
`cat /proc/meminfo`
- **df**: Display filesystem disk space usage.

df -h

- **free**: Show memory usage.
free -h

5. Search While Reading

- **grep**: Search for patterns in a file or stream.
grep "pattern" filename
- Combine cat and grep:
cat filename | grep "pattern"
